OPERATION

1. A continuous, invisible light beam is emitted from the SOLIS® Sensor.

2. As the user enters the beam's effective range, 15" - 30", the beam is reflected into the Scanner Window to activate the Output Circuit. Once activated, the Output Circuit continues in a "hold" mode for as long as the user remains within the effective range of the sensor.

3. When the user steps away from the Sensor, the circuit immediately initiates an electrical "one-time" signal that operates the solenoid. This initiates the flushing cycle to flush the fixture. The circuit then automatically resets and is ready for the next user.
